A FG nucleoporins: 8 of 10 contain regions

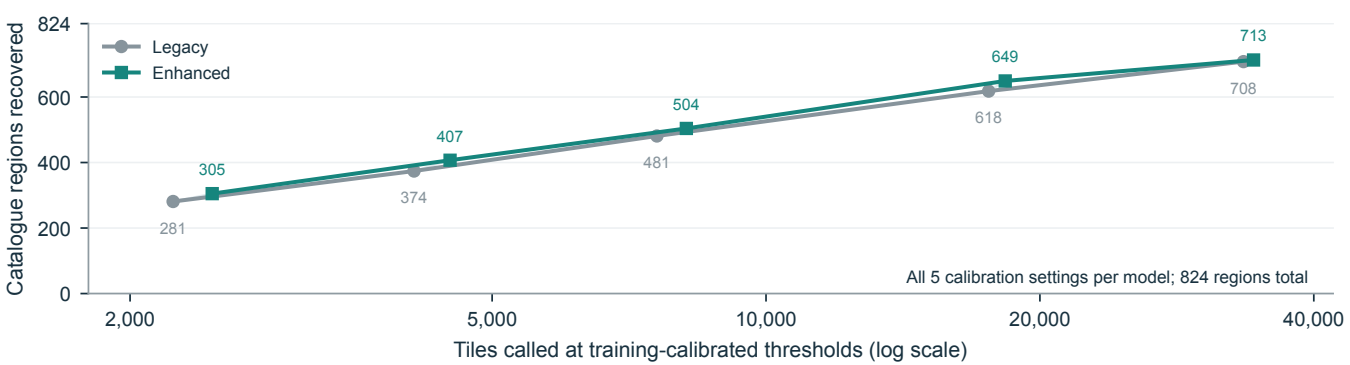

B Paired held-out performance

C Full held-out precision–recall curves

D Region recovery versus calling burden

A: Each protein is normalized to its own length; exact region coordinates and lengths are retained. Catalogue case study, not prospective validation (background 13.5%; matched P = 0.00414). B/C: 314,040 outer-held-out tiles, 3,535 proteins, 3,196 positives. C: Complete curves; dashed line is prevalence. D: All five calibrated settings; connectors pair calibration settings, not equal budgets. Overlapping calls are not independent experiments; catalogue labels are incomplete.
