A Observed similarity and two nulls

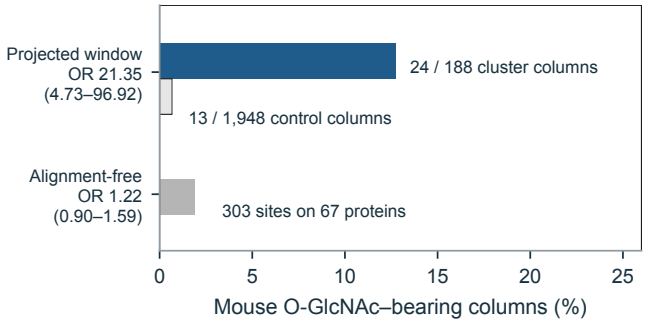

B Excess over each null model

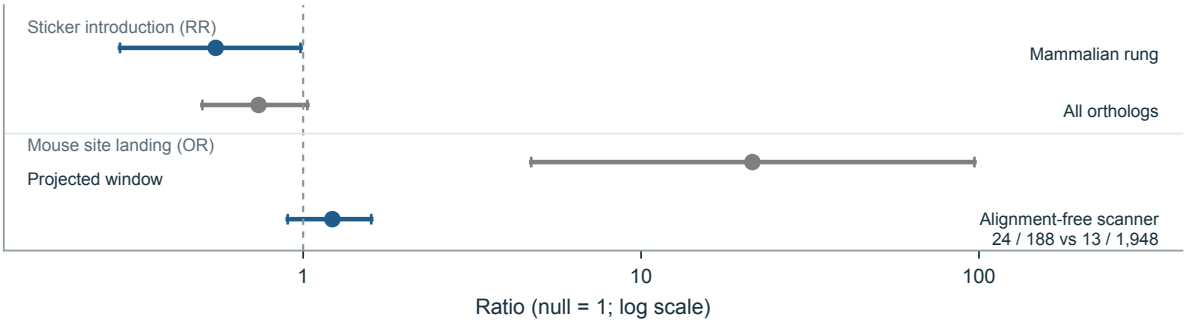

C Positional-conservation sensitivity

D Projected windows versus scanning

E Selective-axis and site-landing controls

Related to Figure 3. Authored vector panels retained. A–B: 168 region pairs on 72 proteins; metric scales differ. C excludes 77 zero-variance pairs and cannot be equivalently null-calibrated. D contrasts different estimands, not competing estimates of the same quantity. E retains the selective-axis and site-landing controls formerly in main Figure 3.
